Background : The food, fodder, fuel, flower, fishery, fibre, livestock and dairy must all satisfy the demand of the projected 9 billion population by 2050 (FAO 2009). And the rise must combat weather variability and climate vulnerabilities. Present day livelihood options from agriculture and allied enterprises witness tradeoff not only in ethics but also the sustainability making the biosphere vulnerable. So there is a need for improved productivity and pricing along with a better utilization of natural resource and energy.

Though research holds its own promise, innovations are on the anvil, and industry is striving to make greater gains through agriculture and allied activities; the existing skill level do not allow the farmer to go for an enterprising mindset. Credit has gone out of agriculture not only because countries became signatories of global reforms and poorer nations treading subsidy withdrawals; this has to do with industry enjoying less convergence with the existing farm produce mix and limited room for post harvest issues.

Scaling up livelihood options, making the industry receptive is another way out to credit solutions. The major jinx is mindset and enterprise composition that can only be addressed through skill development of the farmers towards a more sustainable, remunerative farm commodity basket that will have an industry receptivity. Together, in this new era of skill development the industry should play a greater responsibility in partnering the institutes and governance in skill development.

Towards such a new ushering, the academia have new role to backstop this scenario by identifying the skills in various enterprises from their research repositories that will facilitate the entire process. Envisaging such a role, the International Seminar on “**AGRISKILLS FOR CONVERGENCE IN RESEARCH, INDUSTRY & LIVELIHOOD (ACRIL)**” has been convened by Crop & Weed Science Society – a befitting answer to the tomorrow.

THEME AREAS

1. Crop production and production of allied enterprises with resilience to climate change, abiotic stresses and sustainable natural resource management
2. Biodiversity and improvement in crops & allied fields through classical and advanced breeding techniques; biotechnology, physiology and biochemistry; understanding seed and propagation materials of crops, livestock, fisheries and allied -their quality, and production
3. Biotic stresses in agriculture and allied enterprises, their alleviation, diagnostics & surveillance studies; new mechanisms/ formulations to control and their effect on physiology and flora, fauna and humans.
4. Innovation and skills in value addition, food processing, preservation, post harvest management and income generation.
5. Rationalization of approaches of research, extension, development, marketing, policy interventions.
6. Remote sensing, GIS, modeling, forewarning, forecasting and advisory studies and findings.
7. Group discussion with Industrial scientists and farmers about new important and innovative pesticides / biofertilizers / other agrochemicals
8. A panel discussion envisaging identification of skills, its importance, streamlining new skills in training & capacity building, role of industry and government towards shaping more relevant livelihood patterns having greater resilience to climate and holding promise of sustenance is on the unveil.
